(earlier called "GDP at factor cost") can be compiled by using the estimates of GVA at basic prices and production taxes less subsidies. These have been given in Statement 3.1 of this note. For the years 2011-12, 2012-13 and 2013-14, GVA at factor cost have been compiled and are presented in Statements 10.1 & 10.2 of the press release.[4]Note that GVA at basic prices = GVA at factor cost + net taxes on production and GDP at market prices = GVA at basic prices + net taxes on products.

CSO releases, every January, "first revised estimates", earlier called the "Quick Estimates" of GDP, National Income, per capita National Income, Private Final Consumption Expenditure, Saving and Capital Formation by broad economic sectors[5] for the financial year that ended in March of the preceding year. Quick Estimates for any financial year are thus available with a time lag of ten months. It also releases, along with Quick Estimates for any financial year, revised estimates of national accounts aggregates for earlier financial years. Further, CSO brings out **Advance Estimates of GDP, GNI**, **NNI and per capita NNI**. **The GDP**, **from the base year 2011-12**, **is published at market prices**, **as per the latest international norms**. **Previously, it was published at factor cost**. Advance estimates of the GDPfor the current financial year is published in February, two months before the close of the financial year. These advance estimates are revised thereafter and the undated advance estimates are released by the end of June, three months after the close of the financial year. Meanwhile, by the end of the March, Quarterly Estimates of GDP for the quarter ending December of the preceding year are also released. Thus by the end of March every year, that is, by the end of every financial year, advance estimates of national income for the financial year that just ended, first revised estimates of national income for the preceding financial year and the quarterly estimates of national income up to the preceding quarter, that is, up to the quarter that ended in December of the financial year that just ended become available.

CSO sets before itself an advance release calendar for the release of national accounts statistics over a period of two years.[6] For instance, the Advanced Release Calendar for the years 2015 indicates that the Quarterly Estimate of GDP for any quarter during the period January, 2015 to end of September, 2015 would be available at the end of the next quarter. It also indicates the dates on which Advance Estimates, Quick Estimates and Revised Advance Estimates pertaining to the financial years ending on the 31st March, 2006, 30th June, 2006, 29th September, 2006 and 29th December, 2006, respectively would be released. Similarly, Revised Advance Estimates for the financial year 2004-05, Quick Estimates for the financial year 2004-05, Advance Estimates for the financial year 2005-06 and Revised Advance Estimates for the financial year 2005-06 would be released on the 30th June, 2005, the 31st January, 2006, the 7th February, 2006 and the 30th June, 2006, respectively. CSO has already (30th January, 2015) released the following estimates, as proposed:

i) First Revised Estimates for 2013-14 at current and constant (2011-12) prices,

---

[4] These 2 paragraphs have been taken from the Press release of the CSO dated 30th January 2015.

[5] 1. Agriculture, Forestry & Fishing. 2. Mining & Quarrying, 3. Manufacturing, 4. Electricity, Gas & Water Supply, 5. Construction, 6. Trade, Hotels & Restaurants, 7. Transport, Storage & Communication, 8. Financing, Insurance, Real Estate & Business Services, 9. Community, Social & Personal Services.

[6] This also takes care of SDDS referred to earlier.

ii) First revised Estimates of GDP, National Income, per capita National Income, Consumption Expenditure, Saving and Capital Formation for 2013-14 (along with revised estimates of the earlier two years)at current and constant (2011-12) prices,

iii) Advance Estimates of GDP, GNP and NNP and per capita NNP for 2014-15 at current and constant (2011-12) prices (on the 9th February, 2015).

The **NAS 2014** presents estimates of GNP, NNP and the corresponding domestic products GDP andNDP at factor cost and market prices at current and constant (2004-05) prices[7]. Besides giving estimatesof the components of GDP, estimates like Government Final Consumption Expenditure(GFCE), Private Final Consumption Expenditure (PFCE) in the domestic market, Gross Domestic Saving (GDS), Gross Domestic Capital Formation (GDCF), Exports, Imports, net factor income from abroad and the share ofthe public sector in GDP it presents[8], estimates of the following aggregates *at current and constant prices(2011-12 prices*) for 2013-14 and the period 2011-12 to 2013-14:

i) The contribution to GDP and NDP of different economic activities[9].

ii) Quarterly estimates of GDP by broad economic sectors;

iii) GDP of sub-groups of each of the economic activities (see footnote 9) 1.1 and also separately for its livestock sub-sector[10], 1.2,1.3,3.1,3.2,4, the sub-sectors of 4 namely, electricity, gas and water supply.

iv) NDP for the sub-group 10, namely, Public Administration & Defence, by (a) Central Government and Union Territories; (b) individual State Governments; (c) local authorities; and (d) quasi government bodies.

v) Factor incomes (compensation for employees and operating surplus/mixed income) of NDP for each economic activity (at current prices).

vi) Factor incomes of NDP of the unorganized segment of each economic activity (at current prices).

vii) Property incomes (rent and interest) and Financial Intermediation Services Indirectly Measured (FISIM) in the organized and unorganized segments of each economic activity (at current prices).

viii) Net National Disposable Income, Private Income, Personal Income and Personal Disposable Income.

---

[7] As mentioned earlier, the shift in the base for constant prices to 1999-00 was made in January, 2006, that is, after the publication of NAS 2005 in May, 2005. NAS 2006, due in June, 2006, would be presenting estimates at constant prices at 1999-00. Besides the press note of MoSPI referred to in the text, the **Economic Survey 2006 of the Ministry of Finance** presented by the Finance Minister to Parliament on the 27th February, 2006 also contains estimates released by CSO at current and constant (1999-00) prices for the years 2005-06 (Advanced Estimates), 2004-05 (Quick Estimates), 2003-04 and 2002-03.

[8] Estimates of some of these macro aggregates are also published in the **Monthly Bulletin of RBI**.

[9] 1. Agriculture and Allied Activities; 1.1. Agriculture; 1.2. Forestry& Logging; and 1.3. Fishing; 2. Mining & Quarrying; 3. Manufacturing; 4. Electricity, Gas, Water Supply and other utility services; 5. Construction; 6. Trade, Repair, Hotels & Restaurants; 7. Transport, Storage, Communication and services related to broadcasting; 8. Financial services, 9. Real Estate Ownership of dwelling &Professional Services; 10. Public administration and defence and 11 Other Services;

[10] The livestock sub-sector is a sub-sector of the sub-group ‘agriculture’ (1.1 in the preceding footnote) and includes animal husbandry, (fuel & manure), silk worm cocoons and honey.

ix) GDP and NDP of the Public Sector by type of public sector institutions[11] and economic activity.

x) Factor incomes of Public Sector NDP for each economic activity by type of institutions (current prices).

xi) Property incomes and FISIM in each economics activity of Public Sector by type of institutions.

xii) Value of output, inputs and consumption of fixed capital (CFC) for a number of economic activities.

xiii) Financial Assets and Liabilities of the Household sector.

xiv) Economic and Purpose Classification of Current and Capital Expenditure of Administrative Departments (current prices).

xv) Production Accounts of (a) Railways, (b) Communication, (c) Departmental Enterprises other than (a) and (b), and (d) Producers of Government Services.

xvi) Detailed external transactions accounts.

xvii) Depreciation as provided in the books of accounts of public sector institutional groups[12] and private corporate sector; and

xviii) Time series of GNI, GDP NNP, NDP, Per capita NNI and other macroeconomic aggregates like CFC, net factor income from abroad, PFCE in the domestic market, GFCE exports, imports and mid-year population from 1950-51 to 2013-14[13].

Estimates of the aggregates referred to at (i), (vii), (xiii), (xvi) and PFCE and its distribution by object and by type of goods, GFCE for the period 2004-05 to 2012-13 at current and constant (2004-05)Prices and the time series estimates referred to at (xvii) above at current and constant (2004-05) prices have been released by CSO in NAS 2014 by the end of May 2014 and posted on the **MoSPI website.**

What about separate estimates of National Income aggregates for rural and urban areas? CSO publishes estimates of NDP for rural and urban areas for each economic activity (see footnote 8) at current prices for each of the base year, namely, 1970-71, 1980-81, 1993-94, 1999-2000 and 2004-05.

b) **Other Publications Giving CSO's Estimates**

The Handbook of Statistics on the Indian Economy[14] – 2013-14, published by the **Reserve Bank of India (RBI)** also publishes time series from 1952-53 of macro economic aggregates (that would otherwise have to be compiled from different issues of the NAS document) like GDP at factor cost, CFC, NDP at factor cost, indirect taxes less subsidies, NDP at market prices, net factor income from abroad, GNP at factor cost, NNP at factor cost, GNP at market price, NNP at market price, personal disposable income, GDP and NDP of

---

[11] Administrative Departments, Departmental Enterprises, Non-departmental Enterprises and Quasi-Government Bodies.

[12] Administrative Departments, Public Sector departmental Enterprises subdivided into (i) Railways, (ii) Communication; and (iii) others and Public Sector Non-Departmental Enterprises subdivided into (i) financial companies; and (ii) non-financial companies.

[13] The **Pre-budget Economic survey** also presents the time series on GNP, GDP, NNP and per capita NNP and mid year population.

[14] Published annually. This can downloaded from the RBI WEBSITE http://rbidocs.rbi.org.in/rdocs/Publications/PDFs/000HSE13120914FL.pdf

public sector (from 1960-61), gross and net domestic capital formation, per capita GNP and NNP, at one place. The Economic and Political Weekly research Foundation (EPWRF) also presents comprehensive national income statistics in a time series format from time to time along with details of concepts, methodology and data sources for ready use by researchers. It provides data from **1950-51 to 2011-12 with 2004-05 as the base year (http://www.epwrfits.in/TimeSeriesDataResearch.aspx)"** is the latest. This can be obtained from EPWRF either as a subscriber or through a pay per module mode. National Accounts Statistics of most countries and areas of the world can be accessed at the UNSD website http://unstats.un.org/unsd/nationalaccount/madt.asp. At the time of writing the module, the latest year for which this data is available is 2013.

c) Limitations of the Estimates

The concepts and methodology used and the data sources utilized for making these estimates are set out in two publications of the CSO, namely, **"National accounts statistics : Sources and Methods" (available for the base 2004-05 series, published by the CSO in 2012)** and **"New Series on National Accounts (Base 2004-05)" (CSO, 2010). The MoSPI Press Note dated the 31st January, 2006** releasing Quick Estimates of National Income, etc., for 2004-05 indicates briefly the changes in the new series of National Accounts Statistics with base year 2004-05. The publication NAS- Manual of estimating state and District Income, 2008 provide the methodology for making estimates of GSDP and GDDP. Besides, the publication "National Accounts Statistics" brought out every year has a chapter titled "Notes on Methodology and Revision in the Estimates". This chapter in the NAS also contains tables explaining, sector-wise, reasons for the revision in GDP growth rate as per the different types of estimates (like revised advance, quick, etc., estimates) released in the preceding year. For instance, NAS 2014 gives the reasons for revision in GDP growth rate during.

i) 2012-13 between the provisional Estimates released in May, 2013 and first revised estimates released in January, 2014;

ii) 2011-12 between First Revised Estimates released in January, 2013 and Estimates released in January, 2014; and

iii) 2010-11 between Estimates released in January, 2013 and Estimates released in January, 2014.

Limitations of estimates of national income aggregates arise from insufficiency of data or the choice of data in capturing adequately income flows. Estimates of GDP/NDP at factor cost by sectors can be classified into two broad categories from the point of view of differences in the data base – *direct estimates* and *indirect estimates. Direct estimates* are based on statistics available annually on a regular basis so that these reflect year-to-year variations in the volume of the economic activities concerned. The translation of such annual statistics into National Accounts aggregates requires the use of certain norms and ratios or other assumptions. Resort to readily available indications of the economic activity in question has often to be made *when and if* there are delays on the part of the data-generating agencies in supplying the required regular annual data. As a result, revisions made in the estimates of national accounts aggregates when regular annual data become available later lead to major changes in the provisional estimates released earlier. *Direct estimates* mostly cover the institutional groups, (i) the public sector (and the Government component within it), and (ii) the private corporate sector, or what is usually referred to as the 'organised' segment of the economy. On the other hand, *indirect estimates* require to be made when regular annual statistics are not available in respect of any economic activity. How are these made? Estimates based on periodic benchmark surveys are first derived for the survey year. These are then extrapolated forward or backward, as required, on the basis of physical indicators of the economic activities concerned. The degree of approximation involved in this procedure depends critically on the sensitivity of the indicator in reflecting year-to- year variations in the volume of the economic activity concerned. *Indirect estimates* are used in respect of the institutional groups, (a) households, and (b) non-profit institutions serving households (NPISH) and the "unorganized" segment of the economy. The share of *direct estimates* in aggregate GDP has increased from 57.6 per cent in the series with 1970-71 as the base year to 63.7 per cent in the series with 1980-81 as the base year and to 89.6 per cent in the series with 1993-94 as the base year. The share of *direct estimates* in different sectors in the GDP series with 2004-05 as the base year varied from 100 per cent in Mining, Registered Manufacturing, Electricity, Gas & Water Services, Railways and Public Administration &Defence sector to about 21 per cent in trade sector[15]. As such, the share of organized sector in 2012-13 had become only 44.7 per cent of the economy (with base year 2004-05, page 1i, NAS 2014).

The intention of this sub-section is not to comment adversely on the admittedly complex task of compiling national accounts statistics but to draw attention to limitations that need to be kept in mind by users as economists/statisticians/ analysts utilizing these data while carrying out their research, analytical and advisory work. Improvements in data and methodology for estimating national accounts aggregates constitute a continuous process, calling for efforts across sectors, in which Ministries in the central Government, regulatory agencies, the CSO, the State Directorates of Economics & Statistics and other research institutions participate. The interesting reader may like to familiarize himself/herself with the work being done by **the Indian Association for Research in National Income and Wealth**, **New Delhi**. **Their Bulletin** would show the efforts underway to bring about further improvements in national accounts methodologies and statistics. The recommendations of the **National Statistical Commission (2001)** will also pave the way to further enhancement of the quality of these estimates.

21.3.3 The Input-Output Table

Any economic activity is dependent on inputs from other economic activities for generating its output and the output from this economic activity serves as inputs for producing the output from other activities. Data relating to the interrelationship among different sectors of the economy and among different economic activities are thus important for analyzing the behavior of the economy and, therefore, for formulation of development plans and setting targets of macro variables like output, investment and employment. Such an input-output table will also be useful for analyzing the impact of changes in a sector of the economy or economic activity on other sectors of the economy and indeed the entire economy. An **Input-Output Transactions Table (IOTT)** is prepared by CSO from time to time. The latest to be published is the one relating to **2007-08**[16]. It gives, besides the complete table, the methodology

[15] This paragraph is based on Section 13.2 Chapter 13 of the Report of the National Statistical Commission.

[16] This can be accessed at http://mospi.nic.in/Mospi_New/upload/iott-07-08_6nov12.htm

adopted, the database made use of, analysis of the results and the supplementary tables derived from the IOTT giving the input structure and the commodity composition of the output. The Planning Commission updates and recalibrates the IOTT and prepares an Input-Output table for the base period of a Five Year Plan being formulated and another Input-Output table for the terminal year of the Five Year Plan. The detailed results of this exercise, carried out in the Planning Commission for the formulation of any Five Year Plan, are published by the Planning Commission as the **Technical Note to the Five Year Plan**. The Technical Note contains the relevant Input-Output Table, the methodology adopted and related material. The latest available in this series is the **Technical Note tothe Tenth Five Year Plan.** The IOTT of CSO and the Input-Output Table of the Planning Commission would be useful to researchers interested in exploiting the power of the input-output technique in economic and econometric analysis in their research work.

21.3.4 Regional Accounts – Estimates of State Income and Related Aggregates

a) **Estimates of States Domestic Product (SDP) Prepared and Released by State Governments and Union Territory Administrations**

State Accounts Statistics (SAS) consist of various accounts showing the flows of all transactions between the economic agents constituting the State economy and their stocks. The most important aggregate of SAS is the State Domestic Product (SDP) (State Income). Estimates of GSDP and NSDP at constant and current prices are being prepared and published by the **Directorates of Economics and Statistics (DES) of all State Governments and Union Territory Administrations except** the Union Territory Administrations of **Dadra & Nagar Haveli, Daman & Diu and Lakshadweep.**

b) **Other Publications Giving Estimates of SDP Made by State/UT DES**

The State Governments and Union Territory Administrations send their estimates of SDP to the CSO. These estimates at current and constant prices are available in the **CSO website**. The **pre-Budget Economic Survey** presented to Parliament by the Finance Minister every year contains these estimates (as a time series from 1993-94) of Net State Domestic Product (NSDP) at current prices. The **RBI Handbook** referred to above provides more detailed data drawn from the CSO website. It presents:

i) estimates of NSDP at current and constant prices – one set with the constant prices base 1980-81 for the period 1980-81 to 1998-99 and the other with the constant prices base 1993-94 for 1993-94 to 2003-04; and

ii) estimates of NSDP by economic activity and per capita NSDP at current and constant (1993-94) prices for the period 1993-94 to 2003-04; (new series).

Estimates of State Income (gross State Domestic Product) made by States and Union Territories by economic activity at *current as well as constant prices* are readily available in a (short) time series format at one place in the publication of the **CMIE (EIS)**, **Mumbai** referred to above. These estimates at current and constant prices by sectors for the period 1960-61 to 2000-01 have also been brought together at one place for the use of research scholars by the EPWRF in their publication **Domestic Product of States of India: 1960-61 to 2000-01**

(EPWRF, June, 2003). These are also available on the **website of the EPWRF** and in user-friendly and interactive **CD ROMS**.[17]

c) **Limitations of Estimates of SDP**

The preparation of estimates of SDP call for much more detailed data than for the preparation of national level estimates, especially on flows of goods and services and incomes across geographical boundaries of States/ Union Territories. Conceptually, estimates of SDP can be prepared by adopting two approaches. These are the *income originating approach* and the *income accruing approach.* In the former case, the measurement relates to the *income* ***originating*** *to the factors of production physically located within the area of a state.* In other words it is *the net value of goods and services produced within a state.* In the latter case, the measurement relates to the *income* ***accruing*** *to the factors of production physically located within the area of a State. Here,* the measurement relates to the *income* ***accuring*** *to the normal residents of a State.* The income accruing approach provides better measure of the welfare of the residents of the State. Preparation of estimates of SDP using the income accruing approach is not possible because data on inter-State flow of goods and services are not available. Compilation of other aggregates of State accounts is also problematic because the data required for the purpose, especially on inter-State flows of incomes, are not available.[18] Thus only the *income originating approach is used in preparing estimates of SDP.* This has to be kept in mind while using estimates of SDP.

Efforts have been made by the CSO over the years to bring about a good degree of uniformity across States and Union Territories in SDP concepts and methodology. The major milestones in these efforts are:[19]

i) the recommendations of the **First report of the Committee on Regional Accounts (CSO, 1974)** set up by the Government of India and the **Final Report of the Committee (CSO, 1976)** in the form of a set of Standard Tables to be prepared and a system of regional accounts, besides suggestions regarding steps to fill gaps in data *vis a vis* those needed for compilation of SDP, for the guidance of DES of States/Union Territories;

ii) the article "**Mahabaleshwar Accounts of States"** in the **October, 1976 issue of the Journal of Income & Wealth**;

iii) the article "**The Status of State Income Estimates"** appearing in the **October, 1980 issue of the Monthly Abstract of Statistics (CSO)**; and

iv) the article "Comparable Estimates of SDP – 1970-71 to 1975-76" appearing NAS, January, 1979 of CSO, which described the methodology of preparing estimates of SDP.

v) the publication "**National Accounts Statistics: Manual of Estimating State and District Income**, **2008**" published by the CSO in 2008.

Are the estimates of SDP of different States/Union Territories comparable? Probably not. The successive Finance Commissions have found it necessary to get comparable estimates of NSDP and per capita NSDP made for their use for periods relevant to their work. These comparable estimates of SDP are published in the **Reports of the successive Finance Commissions** from the

[17] E-mail id for queries to EPWRF: epwrf@vsnl.com .

[18] The Report of the National Statistical Commission, Chapter 13 section 13.7.

[19] *ibid.* See also the Preface to EPWRF publication on SDP in the preceding sub-section (b) on other publications giving SDP estimates.

sixties. The **EPWRF publication on SDP** referred to earlier also provides comparable estimates of SDP and evaluates these with reference to those made for the periods 1960-61 to 1964-65, 1976-77 to 1978-79, 1982-83 to 1984-85, 1987-88 to 1989-90 and 1994-95 to 1996-97 for the use of the Finance Commissions. The question of comparability of estimates of SDP of different States/Union Territories is important from the point of view of their use in econometric work involving Inter-State or regional comparisons or the contribution of the regions or the States to the national product.

21.3.5 Regional Accounts – Estimates of Districts Income

The need for preparing estimates of district income has become urgent in the context of decentralization of governance and the importance of, and the emphasis on, decentralized planning or planning from below. Of late, it has gained a special importance, as this is one of the three indicators to compile the district-wise Human Development Index, prepared by some of the States. The State Governments have realized this need and estimates of District Domestic Product (DDP) are being prepared by a number of State DES and published by them in **State Statistical Handbooks/Abstracts/Economic Surveys** and are also posted on **their websites**. The position in different States and Union Territories (zone-wise) is as follows:

Type of estimate of DDP	**State/ UT**	**Base year**
1. for all years till 2013-14	Rajasthan	2004-05
2. for all years till 2012-13	Andhra Pradesh, Arunachal Pradesh, Assam, Madhya Pradesh, Maharashtra, Meghalaya, West Bengal	2004-05
3. for all years till 2011-12	Bihar, Haryana, Himachal Pradesh, Karnataka, Kerala, Chhattisgarh, Punjab, Tamil Nadu, Telangana, Uttar Pradesh	2004-05
4. for all years till 2010-11	Nagaland, Odisha, Uttarakhand	2004-05
5. Up to 2005-06/ 2006-07/ 2007-08	Jharkhand, Mizoram, Andaman &Nicobar Islands/ Manipur / Sikkim	1999 – 2000
6. Not available	Goa, Gujarat, Jammu & Kashmir, Tripura, Delhi, Puducherry	
7. Not required	Chandigarh, as the UT has only 1 district	

For some of the States in 6, it might be available with the State Directorate of Economics and Statistics, but not available centrally at one location.

The methodology for preparing estimates of district income at present is based on[20]

i) The recommendations of the **Report[21] of the Technical Group set up by the Department of Statistics** for recommending a suitable methodology for preparing estimates of district income;

ii) The methodology developed in August, 1996 jointly by the DES of Uttar Pradesh and Karnataka – a task entrusted to these organization by CSO in 1995.

[20] See Methodology of estimating State and District Domestic Product, CSO, 2008.
[21] Submitted in January, 1987.

The *income originating approach* is adopted for compiling district income estimates in the light of the kind of data that is available. As mentioned earlier, the *income accrual approach can* measure the welfare of the normal residents of the district in a more reliable manner. However, as flow of funds from district to district is not available and difficult to estimate, the income originating approach is followed. It is necessary to make adjustments, in the estimates based on the *income originating approach,* for flow of incomes across territories of districts that are rich in resources like minerals or forest resources and where there is a daily flow of commuters from other districts.

There are a lot of problems in the context of data availability separately for each district. For most of the commodity producing sectors, like agriculture, mining and registered manufacturing, data is fairly available. But, in remaining sectors, it is very scanty. Even within the agricultural sector, even if one can get the district-wise production, prices at each district sometimes may not be available. In case of entire unorganized sector, where national and State level estimates are based on periodic surveys, reliable district level estimates from these data cannot be prepared due to limitations in sample size.

21.3.6 National Income and Levels of Living

The foregoing paragraphs have talked about the availability of estimates of macroeconomic aggregates at the national and state levels, in different economic activities, in segments of economic and geographic spaces like public and private sectors, and households and rural and urban areas. What do trends in the magnitude of these variables say about the welfare of different sections of society? Precious little, perhaps, especially when these are considered without information on the manner in which the macroeconomic aggregates are distributed among these sections of society. Per-capita national income or even per-capita personal disposable income can only indicate overall (national) averages. Distribution of population by levels of income can be a big step forward in understanding how well the performance in the growth of GDP has translated into or has not translated into, improvements in levels of living for sections of society below levels considered the minimum desirable level. It would also help us analyse whether inequalities in levels of living have worsened or abated. What about the level of unemployment or levels and quality of employment? What about the health status of people? Or, to consider all these indicators of the state of a society and different sections of society, what are the levels of human development and gender discrimination? Such lines of analysis and the data required for the purpose are important from the point of view of planning for a strategy of growth with equity.

The Quinquennial Consumer Expenditure Surveys of the NSSO provides such data. These provide the distribution of households by monthly per capita consumption expenditure (MPCE) classes. You have already looked at such data and their implications for planning and policy in Unit 4 on "Poverty and Inequality – Policy Implications" in Block 1 on "Framework of the Indian Economy" in Course MEC-105 on "Indian Economic Policy" in your first year course. As you have seen there, the latest available data on this relate to 2011-12, flowing from **the 68th round NSSO survey of 2011-12**. The next such comprehensive survey (74thRound of NSS)is planned in 2016-17. You have also looked at the data on recent trends on growth rate of employment and the growth rate of the economy (employment elasticity) in Unit 5 on "Employment and Unemployment: Policy Implications" and comprehensive indicators like Human Development Index and the Gender Development Index in Units 3 and 4 in Block 1 of Course MEC-005. You would have noted that the **Human Development Reports prepared by the Planning Commission (available on its website) and several State Governments** contain detailed data on these questions.
